

UniLinc™

Your Laundry Partner

UniMac's revolutionary new UniLinc™ control is your management partner helping you reduce costs and improve profitability. Through advanced connectivity and unparalleled control, managers gain easy access to laundry operations data. This information links you to the laundry and opens the door to better management, productivity and efficiency.

Consider the laundry dollar. Understanding where your expenses come from can better equip you to control them. To operate at peak profitability, you should consider five key components:

1. Labor is the largest expense and needs to be allocated wisely.
2. Linen quality is important for maintaining guest satisfaction.
3. Maintenance and advanced troubleshooting of laundry equipment reduces down time.
4. Ease of use, including training and repeatability, means less management time is required.
5. Utilities can be reduced with high efficiency laundry equipment.

UniLinc was designed with these elements in mind; pulling together everything that impacts your laundry's bottom line through the cleanest design on the market.

The Labor Saver

Labor is 50% of the cost of operating a laundry, and using it efficiently is difficult without a full-time supervisor. With UniLinc's real time clock, a manager can read a daily report identifying when cycles started and ended, including the

amount of idle time between cycles. Often this information can determine optimum utilization of labor. Combining these features with UniMac's four fast-fill water valves and Rapid Jetspray Rinse to shorten cycle times, along with super high 300 G-Force extraction to reduce drying time, UniLinc can help your laundry operate at peak profitability. Employing a delayed start can save several hours of labor each week.

UniLinc controlled machines can be loaded at the end of the day and programmed to start an hour before labor is scheduled the following day. A time remaining display adds to employee productivity.

In facilities that require laundry workers to perform duties outside the laundry room, the control can be configured to send a signal to a remote location, such as a front desk. This allows the attendant to focus on the job at task without wasting time.

Quality Control Partner

UniLinc is your partner in the laundry room monitoring if standard operating procedures are being followed. Management can identify if shortcuts impacting quality are being used such as cycles aborted prematurely.

To improve quality results, cycles can be easily programmed. Rapid advance and manual programming functions can be disabled by management to ensure full control.

Maintenance Monitor

Maintenance of equipment keeps your laundry operating more effectively – extending equipment life. UniLinc automatically or on demand displays daily, weekly and monthly maintenance schedules. Scheduled maintenance

tasks for the week are displayed automatically each Monday upon start-up. A quick review of management reports can identify problems before operators are aware of them. For example, an engineer can identify the current water temperature or the actual cylinder speed with a simple touch of a keypad.

When service is required, troubleshooting is streamlined through the special diagnostic screen identifying specific functions. A banner visible during start-up of the washer displays your service company's contact information.

While performing the scheduled preventative maintenance, the facility engineer easily can review any of the 16 alarm codes, including the date, time and cycle number.

Easy-to-Use

Ease of use and repeatability are key considerations for selecting the washer that will aid your profitability. With UniLinc, all operator functions are accessed with just seven soft-touch keypads.

English

Spanish

Multiple languages can be customized for your operation so your laundry staff always will feel comfortable using UniLinc. If your laundry uses less than the available 41 cycles, only those utilized will be displayed. UniLinc's user-friendly story continues as icons and words on the graphic display assist the user. A review of the display enables operators to identify the cycle name, action within it and the time remaining in the cycle. With features such as a one-touch start, training your staff has never been easier.

Utility Miser

Utilities are a controllable expense within the laundry. UniLinc has 30 programmable water levels providing precise cleaning, while conserving water. When combined with UniMac features such as an extra-high, 300 G-Force extraction, it further reduces utility costs. Rapid Jetspray Rinse, a UniMac exclusive, also trims water consumption compared to costly and time-consuming bath rinses.

Your Link to Improved Profitability

With UniLinc as your expert management partner, costs can be reduced and profits improved.

UniLinc Management Reports provide records of time-stamped occurrences of more than 100 activities. This information can be downloaded to exclusive UniLinc software designed for your Windows-based PC. Programming of wash formulas also can be completed on a PC or PDA with UniLinc software.
